

**Example 1** Let uniform mesh be denoted by

$$\Pi_{T,N} = \{iT/N : i = 0, \dots, N\}.$$

- Write pseudocode.

---

**Algorithm 1** Use (1), generate  $\hat{W}$  to simulate a discrete path  $\langle W, \Pi_{T,N} \rangle$ .

---

1: **procedure** EXACTBM1D( $T, N$ )

▷  $T, N$  is ...

2: ...

3: ...

---

- Prove that  $\hat{W}$  is an exact sampling.

- Draw 10 path simulations of  $t \mapsto \frac{W(t)}{\sqrt{2t \log \log t}}$  on interval  $t = [100, 110]$  with mesh size  $h = 0.1$ .

## Algorithm 1

1. procedure: EXACTBM1D( $T, N$ )

2. when  $\hat{w}_0 \rightarrow 0$ ,  $h = T/N$ .

3. for  $i = 0, \dots, N-1$ .

$$W_{t_{i+1}} = W_{t_i} + \sqrt{t_{i+1} - t_i} Z_{i+1} = W_i + \sqrt{h} \cdot Z_i.$$

RETURN  $(W, w_1, w_2, \dots, w_N)$ .

---

2. Prove  $\hat{W}$  is an exact sampling.

▷  $\hat{W}$  is an exact sampling when  $W \equiv 0$

$$2). \hat{W}_i = \sum_{j=0}^{i-1} \sqrt{h} \cdot Z_j = \sqrt{h} \cdot \sum_{j=1}^{i-1} Z_j. \quad Z_i \sim N(0,1), \quad t_i = a_1 \dots a_N$$

Since  $Z_{i+1}$  &  $Z_i$  are iid.

$$\hat{W}_{i+1} - \hat{W}_i = \sqrt{h} \cdot Z_i$$

$$\hat{W}_{i+2} - \hat{W}_{i+1} = \sqrt{h} \cdot Z_{i+1}.$$

⇒  $\hat{W}_i$  has indep. increments

$$3) \hat{W}_i - \hat{W}_j = \sqrt{h} \sum_{n=j}^{i-1} Z_n.$$

Ex 3

**Example 3** Consider Arithmetic asian option price on BSM by exact sampling.

- Write a pseudocode for Arithmetic asian option price on BSM
- To the Gbm class, add a method

arasian(otype, strike, maturity, nstep, npath)

for the price by exact sampling.

- Use your code to compute Arithmetic asian option of

$$S_0 = 100.0, \sigma = 0.20, r = 0.0475, K = 110.0, T = 1.0, \text{otype} = 1, \text{nstep} = 5.$$

Algorithm 2.

1. Procedure: EXACT Arasian. (otype, strike, maturity, nstep, npath)

2.  $\omega \rightarrow 0$ .  $h = T/N$ .

3. For
